# 1 Product Description

TRW-24G is a wireless transceiver module which adopts 2.4G ISM band with printed antenna on board to provide the optimal transmission and reception in signal. TRW-24G is a good solution for short and median range applications, such as Wireless Joysticks, cordless phone, wireless earphone, wireless mouse and keyboard, due to its adjustable transmission power level. It is also suitable for surveillance system because of its frequency hopping technology which provides a safe

## 1.1 Key Feature

- Frequency Range: 2.4~2.527GHz
- Modulation: GFSK
- Work Voltage: 3V
- Channel No.: 128 CH
- Output Power: Max. 0 dBm.
- Active Mode : ShockBurst Mode and Direct Mode
- Data Rate: 1 Mbps at ShockBurst Mode  
250 Kbps at Direct Mode
- Transmission range : 150M at ShockBurst Mode  
280M at Direct Mode
- Max two channels active simultaneously
- Built-in antenna.
- Low Power consumption: Active@1Mbps: 25 mA  
Standby: 12 uA
- Operating Temperature: -10~+70°C
- Application : Wireless Joysticks, Wireless Speaker, Wireless Earphone , Wireless Cell phone , Wireless Intercom , Wireless Mouse, Wireless Keyboard , Surveillance and security system and Data Communication.

## 2 Block Diagram

This block diagram details the whole structure of this module which allows user to adopt two channels simultaneously without adding any extra components except micro-controller. We shall have reference schematic how this module works with micro-controller in the subsequence.

## 3 Pin Function

Pin	Name	Category	I/O	Description
1	CLK1	Digital	Input/Output	For channel 1 clock TX: Clock input RX: Clock input/output
2	CS	Digital	Input	Chip selection activates Configuration Mode
3	CLK2	Digital	Input/Output	For channel 2 clock Rx: Clock input/output
4	CE	Digital	Input	Chip Enable to active RX / TX mode H: TX mode L: Rx mode
5	GND	Power		Ground
6	VCC	Power		Power supply
7	DR2	Digital	Output	Data ready for channel 2 to output (*) H: Data ready for accessing
8	DOUT	Digital	Output	Channel 2 Data output
9	DR1	Digital	Output	Data ready for channel 1 to output (*) H: Data ready for accessing
10	DATA	Power	Input/output	DATA pin can act as channel 1 data output and configuration data input pin. CS = H, Configuration data input CS = L, Channel 1 data output

\* DR1 & DR2 are only available for ShockBurst mode.

## 4 Hardware Specification

### 4.1 Specification

Conditions: VDD = +3V, VSS = 0V, TA = - 40°C to + 85°C

Symbol	Parameter (condition)	Notes	Min.	Typ.	Max.	Units
<b>Operating conditions</b>						
VDD	Supply voltage		1.9	3.0	3.6	V
TEMP	Operating Temperature		-40	+27	+85	°C
<b>Digital input pin</b>						
V <sub>IH</sub>	HIGH level input voltage		VDD- 0.3		VDD	V
V <sub>IL</sub>	LOW level input voltage		V <sub>SS</sub>		0.3	V
<b>Digital output pin</b>						
V <sub>OH</sub>	HIGH level output voltage (I <sub>OH</sub> =-0.5mA)		VDD- 0.3		VDD	V
V <sub>OL</sub>	LOW level output voltage (I <sub>OL</sub> =0.5mA)		V <sub>SS</sub>		0.3	V
<b>General RF conditions</b>						
f <sub>OP</sub>	Operating frequency	1)	2400		2524	MHz
f <sub>XTAL</sub>	Crystal frequency	2)	4		20	MHz
Δf	Frequency deviation			±156		kHz
R <sub>QFSK</sub>	Data rate ShockBurst™		>0		1000	kbps
R <sub>DFSK</sub>	Data rate Direct Mode	3)	250		1000	kbps
F <sub>CHANNEL</sub>	Channel spacing			1		MHz
<b>Transmitter operation</b>						
P <sub>RF</sub>	Maximum Output Power	4)		0	+4	dBm
P <sub>RFC</sub>	RF Power Control Range		16	20		dB
P <sub>RFCR</sub>	RF Power Control Range Resolution				±3	dB
P <sub>BW</sub>	20dB Bandwidth for Modulated Carrier				1000	kHz
P <sub>RF2</sub>	2 <sup>nd</sup> Adjacent Channel Transmit Power 2MHz				-20	dBm
P <sub>RF3</sub>	3 <sup>rd</sup> Adjacent Channel Transmit Power 3MHz				-40	dBm
I <sub>VDD</sub>	Supply current @ 0dBm output power	5)		13		mA
I <sub>VDD</sub>	Supply current @ -20dBm output power	5)		8.8		mA
I <sub>VDD</sub>	Average Supply current @ -5dBm output power, ShockBurst™	6)		0.8		mA
I <sub>VDD</sub>	Average Supply current in stand-by mode	7)		12		μA
I <sub>VDD</sub>	Average Supply current in power down			400		nA
<b>Receiver operation</b>						
I <sub>VDD</sub>	Supply current one channel 250kbps			18		mA
I <sub>VDD</sub>	Supply current one channel 1000kbps			19		mA
I <sub>VDD</sub>	Supply current two channels 250kbps			23		mA
I <sub>VDD</sub>	Supply current two channels 1000kbps			25		mA
RX <sub>SENS</sub>	Sensitivity at 0.1%BER (@250kbps)			-90		dBm
RX <sub>SENS</sub>	Sensitivity at 0.1%BER (@1000kbps)			-80		dBm
C/I <sub>CO</sub>	C/I Co-channel	8)		10/4		dB
C/I <sub>1ST</sub>	1 <sup>st</sup> Adjacent Channel Selectivity C/I 1MHz	8)		-20/0		dB
C/I <sub>2ND</sub>	2 <sup>nd</sup> Adjacent Channel Selectivity C/I 2MHz	8)		-37/-20		dB
C/I <sub>3RD</sub>	3 <sup>rd</sup> Adjacent Channel Selectivity C/I 3MHz	8)		-43/-30		dB
RX <sub>B</sub>	Blocking Data Channel 2			-45/-41		dB

- Usable band is determined by local regulations
- The crystal frequency may be chosen from 5 different values (4, 8, 12, 16, and 20MHz) which are specified in the configuration word, see Table 9. 16MHz are required for 1Mbps operation.
- Data rate must be either 250kbps or 1000kbps.
- Antenna load impedance = 100W+j175W
- Antenna load impedance = 100W+j175W. Effective data rate 250kbps or 1Mbps.
- Antenna load impedance = 100W+j175W. Effective data rate 10kbps.
- Current if 4 MHz crystal is used.
- 250kbps / 1000kbps.

## 4.2 Reference schematics

Attached reference schematics give an example how to have TRW-24G module to work with micro-controller, it might be 8051, chips of microchip or any embedded SOC, to communicate with host through RS-232 interface. U4 is RS-232 transceiver chip which converts signals level.

## 5 Configuration and Operation Modes

TRW-24G 2.4Ghz module has three modes, Active, Configuration and Stand by; which depends on the setting of signal CE and CS. The following Table details the setting.

Mode	CE	CS
Active (RX/TX)	1	0
Configuration	0	1
Stand by	0	0

Device allows user to have two communication models in Active mode – Direct Mode and ShockBurst to transmit and receive data from remote parties. It depends on the content of configuration to set up the working models.

Configuration Mode allows user to setup the following settings:

1. Communication Mode : Direct Mode  
ShockBurst Mode
2. Transmit power
3. Frequency selection for Channel 1 & 2
4. Data Rate
5. One / Two receiving simultaneously

Stand-by mode is used to minimize average current consumption while maintaining short start up times. The configuration word content is maintained during stand by.

The following introduction shall commence from configuration setting

## 5.1 Configuration Mode

All configuration of the TRW-24G is done via 3-wire interface to a single configuration register. The configuration word can be up to 15 bytes long for ShockBurst™.

### 5.1.1 Configuration of ShockBurst™ operation:

The configuration word in ShockBurst™ enables the TRW-24G to handle the RF protocol. Once the protocol is completed and loaded into TRW-24G only one byte, bit [7:0], needs to be updated during actual operation.

The configuration blocks dedicated to ShockBurst™ is as follows:

1. **Payload section width:** Specifies the number of payload bits in a RF package. This enables the TRW-24G to distinguish between payload data and the CRC bytes in a received package.
2. **Address width:** Sets the number of bits used for address in the RF package, This enables the TRW-24G to distinguish between address and payload data.
3. **Address** (RX Channel 1 and 2): Destination address for received data.
4. **CRC:** Enables TRW-24G on-chip CRC generation and de-coding.

#### NOTE

These configuration blocks, with the exception of the CRC, are dedicated for the packages that a TRW-24G is to receive. In TX mode, the MCU must generate an address and a payload section that fits the configuration of the TRW-24G that is to receive the data. When using the TRW-24G on-chip CRC feature ensure that CRC is enabled and uses the same length for both the TX and RX devices.

PRE-AMBLE	ADDRESS	PAYLOAD	CRC
-----------	---------	---------	-----

Figure 1 Data packet set-up

### 5.1.2 Configuration for Direct Mode operation

For direct mode operation only the two first bytes (bit[15:0]) of the configuring word are relevant.

#### Configuration word overview

	Bit Position	Number of bits	Name	Function
ShockBurst™ configuration	143:120	24	TEST	Reserved for testing
	119:112	8	DATA2_W	Length of data payload section RX channel 2
	111:104	8	DATA1_W	Length of data payload section RX channel 1
	103:64	40	ADDR2	Up to 5 byte address for RX channel 2
	63:24	40	ADDR1	Up to 5 byte address for RX channel 1
	23:18	6	ADDR_W	Number of address bits (both RX channels).
	17	1	CRC_L	8 or 16 bit CRC
	16	1	CRC_EN	Enable on-chip CRC generation/checking.

	Bit Position	Number of bits	Name	Function
General device configuration	15	1	RX2_EN	Enable two channel receive mode
	14	1	CM	Communication mode (Direct or ShockBurst™)
	13	1	RFDR_SB	RF data rate (1Mbps requires 16MHz crystal)
	12:10	3	XO_F	Crystal frequency
	9:8	2	RF_PWR	RF output power
	7:1	7	RF_CH#	Frequency channel
	0	1	RXEN	RX or TX operation

**Table 1 Table of configuration words**

The configuration word is shifted in MSB first on positive CLK1 edge, new configuration is enabled on the falling edge of CS.

**NOTE**

On the falling edge of CS, the TRW-24G updates the number of bits actually shifted in during the last configuration.

**Example**

If the TRW-24G is to be configured for 2 channel RX in ShockBurst™, a total of 120 bits must be shifted in during the first configuration after VDD is applied.

Once the wanted protocol, modus and RF channel are set, only one bit (RXEN) is shifted in to switch between RX and TX.

**5.1.3 Configuration Word Detailed Description**

The following describes the function of the 144 bits (bit 143=MSB) that is used to configure the TRW-24G

General Device Configuration: bit [15:0]

ShockBurst™ Configuration: bit [119:0]

Test Configuration: bit [143:120]

MSB	TEST							
D143	D142	D141	D140	D139	D138	D137	D136	
Reserved for testing								
1	0	0	0	1	1	1	0	Default

MSB	TEST															
D135	D134	D133	D132	D131	D130	D129	D128	D127	D126	D125	D124	D123	D122	D121	D120	
Reserved for testing															Close PLL in TX	
0	0	0	0	1	0	0	0	0	0	0	1	1	1	0	0	Default

DATA2 W								
D119	D118	D117	D116	D115	D114	D113	D112	
Data width channel#2 in # of bits excluding addr/crc								
0	0	1	0	0	0	0	0	Default

DATA1 W								
D111	D110	D109	D108	D107	D106	D105	D104	
Data width channel#1 in # of bits excluding addr/crc								
0	0	1	0	0	0	0	0	Default

ADDR2												
D103	D102	D101	....	D71	D70	D69	D68	D67	D66	D65	D64	
Channel#2 Address RX (up to 40bit)												
0	0	0	...	1	1	1	0	0	1	1	1	Default

ADDR1												
D63	D62	D61	....	D31	D30	D29	D28	D27	D26	D25	D24	
Channel#1 Address RX (up to 40bit)												
0	0	0	...	1	1	1	0	0	1	1	1	Default

ADDR_W						Default
D23	D22	D21	D20	D19	D18	
Address width in # of bits (both channels)						
0	0	1	0	0	0	

CRC		Default
D17	D16	
CRC Mode 1 = 16bit, 0 = 8bit		
CRC 1 = enable; 0 = disable		
0	1	

RF-Programming														LSB	Default
D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	
Two Ch.	BUF	OD	XO Frequency		RF Power		Channel selection							RX/TX	
0	0	0	0	1	1	1	1	0	0	0	0	0	1	0	0

**Table 2 Configuration data word**

The MSB bit should be loaded first into the configuration register.  
 Default configuration word: h8E08.1C20.2000.0000.00E7.0000.0000.E721.0F04.

## 5.2 ShockBurst™ configuration

The section B[119:16] contains the segments of the configuration register dedicated to ShockBurst™ operational protocol. After VDD is turned on ShockBurst™ configuration is done once and remains set whilst VDD is present, during operation only the first byte for frequency channel and RX/TX switching need to be changed.

### PLL\_CTRL

PLL_CTRL		
D121	D120	PLL
0	0	Open Tx / Closed Rx
0	1	Open Tx / Open Rx
1	0	Closed Tx / Closed Rx
1	1	Closed Tx / Open Rx

**Table 3 PLL setting**

Bit 121-120:

PLL\_CTRL: Controls the setting of the PLL for test purposes. With closed PLL in TX no deviation will be present. For normal operational mode these two bits must both be low.

### DATAx\_W

DATA2_W							
119	118	117	116	115	114	113	112
DATA1_W							
111	110	109	108	107	106	105	104

**Table 4 Number of bits in payload**

Bit 119-112:

DATA2\_W: Length of RF package payload section for receive-channel 2.

Bit 111-104:

DATA1\_W: Length of RF package payload section for receive-channel 1.

**NOTE**

The total number of bits in a ShockBurst™ RF package may not exceed 256!  
 Maximum length of payload section is hence given by:

$$\text{DATA}_x\_W(\text{bits}) = 256 - \text{ADDR}_W - \text{CRC}$$

Where:

ADDR\_W: length of RX address set in configuration word B[23:18]

CRC: check sum, 8 or 16 bits set in configuration word B[17]

PRE: preamble, 4 or 8 bits are automatically included

Shorter address and CRC leaves more room for payload data in each package.

**ADDRx**

ADDR2											
103	102	101	.....	71	70	69	68	67	66	65	64
ADDR1											
63	62	61	.....	31	30	29	28	27	26	25	24

**Table 5 Address of receiver #2 and receiver #1**

Bit 103-64:

ADDR2: Receiver address channel 2, up to 40 bit.

Bit 63-24:

ADDR1: Receiver address channel 1, up to 40 bit.

**NOTE**

Bits in ADDRx exceeding the address width set in ADDR\_W are redundant and can be set to logic 0.

**ADDR\_W & CRC**

ADDR_W						CRC_L	CRC_EN
23	22	21	20	19	18	17	16

**Table 6 Number of bits reserved for RX address + CRC setting**

Bit 23-18:

ADDR\_W: Number of bits reserved for RX address in ShockBurst™ packages.

**NOTE**

Maximum number of address bits is 40 (5 bytes). Values over 40 in ADDR\_W are not valid.

Bit 17:

CRC\_L: CRC length to be calculated by TRW-24G in shockBurst.

Logic 0: 8 bit CRC

Logic 1: 16 bit CRC

Bit 16:

CRC\_EN: Enables on-chip CRC generation (TX) and verification (RX).

Logic 0: On-chip CRC generation/checking disabled

Logic 1: On-chip CRC generation/checking enabled

**NOTE**

An 8 bit CRC will increase the number of payload bits possible in each ShockBurst™ data packet, but will also reduce the system integrity.

### 5.3 General device configuration

This section of the configuration word handles RF and device related parameters modes:

RX2_EN	CM	RFDR_SB	XO_F			RF_PWR	
15	14	13	12	11	10	9	8

**Table 7 RF operational settings**

Bit 15:

RX2\_EN:

- Logic 0: One channel receive
- Logic 1: Two channels receive

**NOTE**

In two channels receive, the TRW-24G receives on two, separate frequency channels simultaneously. The frequency of receive channel 1 is set in the configuration word B[7-1], receive channel 2 is always 8 channels (8 MHz) above receive channel 1.

Bit 14:

Communication Mode:

- Logic 1: operates in ShockBurst™ mode

Bit 13:

RF Data Rate:

- Logic 0: 250 kbps
- Logic 1: 1 Mbps

**NOTE**

Utilizing 250 kbps instead of 1 Mbps will improve the receiver sensitivity by 10 dB. 1 Mbps requires 16MHz crystal.

Bit 12-10:

XO\_F: Selects the crystal frequency to be used. Default to be 16MHz.

XO FREQUENCY SELECTION			
D12	D11	D10	MHz
0	0	0	4
0	0	1	8
0	1	0	12
0	1	1	16
1	0	0	20

**Table 8 Crystal frequency setting**

Bit 9-8:

RF\_PWR: Sets TRW-24G RF output power in transmit mode:

RF OUTPUT POWER		
D9	D8	P[dBm]
0	0	-20
0	1	-10
1	0	-5
1	1	0

Table 9 RF output power setting

RF channel & direction

RF CH#							RXEN
7	6	5	4	3	2	1	0

Table 10 Frequency channel + RX/TX setting

Bit 7-1:

RF\_CH#: Sets the frequency channel the nRF2401 operates on.

The channel frequency in **transmit** is given by:

$$Channel_{RF} = 2400 \text{ MHz} + RF\_CH\# \cdot 1.0 \text{ MHz}$$

RF\_CH # : between 2400MHz and 2527MHz may be set.

The channel frequency in **data channel 1** is given by:

$$Channel_{RF} = 2400 \text{ MHz} + RF\_CH\# \cdot 1.0 \text{ MHz} \text{ (Receive at PIN\#8)}$$

RF\_CH # : between 2400MHz and 2524MHz may be set.

**NOTE**

The channels above 83 can only be utilized in certain territories (ex: Japan)

The channel frequency in **data channel 2** is given by:

$$Channel_{RF} = 2400 \text{ MHz} + RF\_CH\# \cdot 1.0 \text{ MHz} + 8\text{MHz}$$

(Receive at PIN#4)

RF\_CH # : between 2408MHz and 2524MHz may be set.

Bit 0:

Set active mode:

Logic 0: transmit mode

Logic 1: receive mode

## 5.4 Data Package Description

The data packet for both ShockBurst™ mode and direct mode communication is divided into 4 sections. These are:

**Figure 2 Data Package Diagram**

Hereby is the information in detail about these 4 sections.

<b>1. PREAMBLE</b>	<ul style="list-style-type: none"> <li>The preamble field is required in ShockBurst and Direct Mode</li> <li>Preamble is 8 bits in length and is dependent of the first data bit in direct mode.</li> </ul> <table style="margin-left: 20px;"> <tr> <td>PREAMBLE</td> <td>1st ADDR-BIT</td> </tr> <tr> <td>01010101</td> <td>0</td> </tr> <tr> <td>10101010</td> <td>1</td> </tr> </table>	PREAMBLE	1st ADDR-BIT	01010101	0	10101010	1
PREAMBLE	1st ADDR-BIT						
01010101	0						
10101010	1						
<b>2. ADDRESS</b>	<ul style="list-style-type: none"> <li>The address field is required in ShockBurst mode.</li> <li>8 to 40 bits length.</li> <li>Address automatically removed from received packet in shockBurst mode. In Direct Mode MCU must handle address</li> </ul>						
<b>3. PAYLOAD</b>	<ul style="list-style-type: none"> <li>The data to be transmitted</li> <li>In Shock-Burst mode payload size is 256 bits minus the following: (Address: 8 to 40 bits. + CRC 8 or 16 bits).</li> </ul>						
<b>4. CRC</b>	<ul style="list-style-type: none"> <li>The CRC is optional in ShockBurst™ mode, and is not used in Direct mode</li> <li>8 or 16 bits length</li> <li>The CRC is removed from the received output data in ShockBurst™ RX.</li> </ul>						

## 5.5 ShockBurst™

The ShockBurst™ technology uses on-chip FIFO to clock in data at a low data rate and transmit at a very high rate thus enabling extremely power reduction.

When operation the TRW-24G in ShockBurst™, you gain access to the high data rates(1 Mbps) offered by the 2.4GHz band without the need of a costly, high-speed micro controller (MCU) for data processing.

By putting all high speed signal processing related to RF protocol on-chip, the TRW-24G offers the following benefits:

1. Highly reduced current consumption.
2. Lower system cost (facilitates use of less expensive micro controller).
3. Greatly reduced risk of 'on-air' collisions due to short transmission time.

The TRW-24G can be programmed using a simple 3-wire interface where the data rate is decided by the speed of the micro controller.

By allowing the digital part of the application to run at low speed while maximizing the data rate on the RF link, the nRF ShockBurst™ mode reduces the average current consumption in applications considerably.

### 5.5.1 ShockBurst™ principle

When the TRW-24G is configured in ShockBurst™, TX or RX operation is conducted in the following way (10 kbps for the example only).

Figure 3 Clocking in data with MCU and sending with ShockBurst™ technology

Figure 4 Current consumption with & without ShockBurst™ technology

Figure 5 Flow Chart shockBurst™ Transmit of TRW-24G

## 5.5.2 TRW-24G ShockBurst™ Transmit

MCU interface pins:CE,CLK1,DATA

1. When the application MCU has data to send, set CE high. This activates TRW-24G on-board data processing.
2. The address of the receiving node(RX address) and payload data is clocked into the TRW-24G. The application protocol or MCU sets the speed <1Mbps(ex:10kbps)>.
3. MCU sets CE low, this activates a TRW-24G ShockBurst™ transmission.
4. TRW-24G ShockBurst™:
  - RF front end is powered up.
  - RF package is completed (preamble added, CRC calculated).
  - Data is transmitted at high speed (250kbps or 1 Mbps configured by user).
  - TRW-24G returns to stand-by when finished.

**Figure 6 Flow Chart ShockBurst™ Receive of TRW-24G.**

### 5.5.3 TRW-24G ShockBurst™ Receive

MCU interface pins: CE, DR1, CLK1 and DATA (one RX channel receive)

1. Correct address and size of payload of incoming RF packages are set when TRW-24G is configured to ShockBurst™ RX.
2. To activate RX, set CE high.
3. After 200us settling, TRW-24G is monitoring the air for incoming communication.
4. When a valid package has been received (correct address and CRC found), TRW-24G removes the preamble, address and CRC bits.
5. TRW-24G then notifies (interrupts) the MCU by setting the DR1 pin high.
6. MCU may (or may not) set the CE low to disable the RF front end (low current mode).
7. The MCU will clock out just the payload data at a suitable rate (ex, 10 kbps).
8. When all payload data is retrieved TRW-24G sets DR1 low again, and is ready for new incoming data package if CE is kept high during data download. If the CE was set low, a new start up sequence can begin, see Figure 12.

### 5.5.4 Duoceiver™ Simultaneous Two Channel Receive Mode

In ShockBurst™ mode the TRW-24G can facilitate simultaneous reception of two parallel independent frequency channels at the maximum data rate. This means:

1. TRW-24G can receive data from two 1Mbps transmitters (ex: TRW-24G or TRW-24G) 8MHz (8 frequency channels) apart through one antenna interface.
2. The output from the two data channels is fed to two separate MCU interfaces.
3. Data channel 1: CLK1, DATA, and DR1
4. Data channel 2: CLK2, DOUT2, and DR2
5. DR1 and DR2 are available only in ShockBurst™.

The TRW-24G DuoCeiver™ technology provides 2 separate dedicated data channels for RX and replaces the need for two, stand alone receiver systems.

Figure 7 Simultaneous 2 channel receive on TRW-24G

There is one absolute requirement for using the second data channel. For the TRW-24G to be able to receive at the second data channel the frequency channel must be 8MHz higher than the frequency of data channel 1. The TRW-24G must be programmed to receive at the frequency of data channel 1. No time multiplexing is used in TRW-24G to fulfil this function. In direct mode the MCU must be able to handle two simultaneously incoming data packets if it is not multiplexing between the two data channels. In ShockBurst™ it is possible for the MCU to clock out one data channel at a time while data on the other data channel waits for MCU availability, without any lost data packets, and by doing so reduce the needed performance of the MCU.

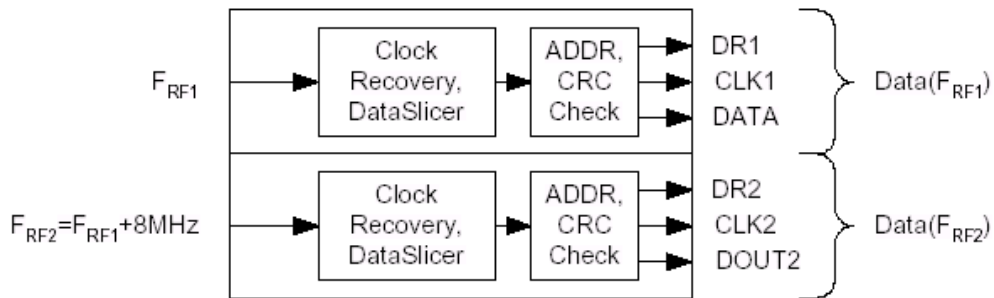

Figure 8 DuoCeiver™ with two simultaneously independent receive channels

## 5.6 Direct Mode

In direct mode the nRF2401 works like a traditional RF device. Data must be at 1Mbps  $\pm$ 200ppm, or 250kbps  $\pm$ 200ppm at low data rate setting, for the receiver to detect the signals.

### 5.6.1 Direct Mode Transmit

MCU interface pins: CE, DATA

1. When application MCU has data to send, set CE high
2. The nRF2401 RF front end is now immediately activated, and after 200 ms settling time, data will modulate the carrier directly.
3. All RF protocol parts must hence be implemented in MCU firmware (preamble, address and CRC).

### 5.6.2 Direct Mode Receive

MCU interface pins: CE, CLK1, and DATA

1. Once the nRF2401 is configured and powered up (CE high) in direct RX mode, DATA will start to toggle due to noise present on the air.
2. CLK1 will also start to toggle as nRF2401 is trying to lock on to the incoming data stream.
3. Once a valid preamble arrives, CLK1 and DATA will lock on to the incoming signal and the RF package will appear at the DATA pin with the same speed as it is transmitted.
4. To enable the demodulator to re-generate the clock, the preamble must be 8 bits toggling hi-low, starting with low if the first data bit is low.
5. In this mode no data ready (DR) signals is available. Address and checksum verification must also be done in the receiving MCU.

### 5.6.3 DuoCeiver™ Simultaneous Two Channel Receive Mode

In direct mode, it can facilitate simultaneous reception of two parallel independent frequency channels as ShockBurst™ mode. Please refer to section 5.5.4.

# TRW-24G ShockBurst Mode configuration data starts from MSB.

## 6 Important Timing Data

The following timing applies for operation of TRW-24G module

### TRW-24G Timing Information:

nRF2401 timing	Max.	Min.	Name
PWR_DWN → ST_BY mode	3ms		Tpd2sby
PWR_DWN → Active mode (RX/TX)	3ms		Tpd2a
ST_BY → TX ShockBurst™	195μs		Tsby2txSB
ST_BY → TX Direct Mode	202μs		Tsby2txDM
ST_BY → RX mode	202μs		Tsby2rx
Minimum delay from CS to data.		5μs	Tcs2data
Minimum delay from CE to data.		5μs	Tce2data
Minimum delay from DRI/2 to clk.		50ns	Tdr2clk
Maximum delay from clk to data.	50ns		Tclk2data
Delay between edges		50ns	Td
Setup time		500ns	Ts
Hold time		500ns	Th
Delay to finish internal GFSK data		1/data rate	Tfd
Minimum input clock high		500ns	Thmin
Set-up of data in Direct Mode	50ns		Tsdm
Minimum clock high in Direct Mode		300ns	Thdm
Minimum clock low in Direct Mode		230ns	Tldm

Table 11 Switching times for TRW-24G

When the TRW-24G is in power down it must always settle in stand-by(Tpd2sby) before it can enter configuration or one of the active modes.

Figure 9 Timing diagram for TRW-24G (or VDD off) to stand by mode.

Figure10 VDD off to active mode

Note that the configuration word will be lost when VDD is turned off and that the device then must be configured before going to one of the active modes. If the device is configured one can go directly from power down to the wanted active mode.

**NOTE**

CE and CS may not be high at the same time. Setting one or the other decides whether configuration or active mode is entered.

WENSHING Confidential  
Do Not Distribution

## 6.1 Configuration mode timing

When one or more of the bits in the configuration word needs to be changed the following timing apply.

Figure11 Timing diagram for configuration of TRW-24G

If configuration mode is entered from power down, CS can be set high after  $T_{pd2sby}$  as shown in Figure 8

### 6.1.1 ShockBurst™ Mode timing

#### 6.1.1.1 ShockBurst™ TX

Figure12 Timing of ShockBurst™ in TX

The package length and the data rate give the delay  $T_{oa}$  (time on air), as shown in the equation.

$$T_{OA} = 1 / \text{datarate} \cdot (\#\text{databits} + 1)$$

### 6.1.1.2 ShockBurst™ RX

Figure13 Timing of ShockBurst™ in RX

The CE may be kept high during downloading of data, but the cost is higher current consumption (18mA) and the benefit is no start-up time(200µs) after the DR1 goes low.

## 6.2 Output Power adjustment

Conditions: VDD= 3.0V, VSS= 0V,  $T_A= 27^\circ\text{C}$  , Load impedance =400Ω

Power setting bits of configuring word	RF output power	DC current consumption
.1	0 dBm ±3dB	13.0 mA
.0	-5 dBm ±3dB	10.5 mA
01	-10 dBm ±3dB	9.4 mA
00	-20 dBm ±3dB	8.8 mA

/* -----

```

This program is Kit\_10 to configure TRW\_24G/TRW\_24G part.

Which is used RF\_Status [7] and RF\_Buffer [110] array.

Here's RF\_Status [7] array of detailed definitions:

RF\_Status[0] = 0 , Modules work is in the state of launch

= 1 , Modules work is in the receiving state

RF\_Status[1] = Neglected

RF\_Status[2][3] = To retain frequencies via 16-band.

If its value = 0x0190, it express operating frequency now is 2400 M.

If its value = 0x01B0, it express operating frequency now is 2400 M.

RF\_Status[4] = 0, Modules work is in the rate of 1 M

= 1 , Modules work in the 250 K rate.

RF\_Status[5] = 0, Set up the transmitter power modules is for -20 dBm

= 1 , Set up the transmitter power modules is for -0 dBm

RF\_Status[6] = 0, Modules work is in the direct model

= 1 , Modules work is in the ShockBurth model

.

```
